# White Paper

Version 1 - 15 Jan 2021

English Edition

Smart contract : TRONCB

**Disclaimer:**

The laws and regulations of countries in the field of crypto currency are different and it is not allowed to invest the crypto currency in your country, so the investor is responsible for the investment. The risk of investing in smart contracts is high. Project creator and the programming team have no responsibility.

## **Introduction:**

After extensive studies on various types of Dapp projects and their review, the Crypto Bank programming team has taken action to improve the weaknesses of other smart contracts and created a new and different contract. The contract is written in Solidity version 0.5.10 and has been launched on the TRON blockchain network platform.

Due to the lower price of TRON compared to other Crypto currencies, most Dapps are registered on this network. TRON Crypto currency has a very good future and its long-term maintenance has been recommended by many Crypto market analysts. Instead of keeping currency in software and hardware wallets (which do not pay dividends), you can invest in the TRONCB project, which is the work of the Crypto Bank team.

## **Project introduction:**

As mentioned in the introduction, TRONCB contract has used the problems of other projects and has used them to improve the design of a very safe and secure contract. Some of the most important problems of other projects are as follows:

- ❖ They have no investment restrictions (whales and the creator of the project enter in the first hours of the contract and make a profit and leave sooner).
- ❖ Initial investors usually make a profit, and those who invest in the following days actually make a profit for the initial investors.
- ❖ There is no specific process for making a profit (if a new investor does not enter, the project will be zero).
- ❖ Fear of losing deposit and successive withdrawals.
- ❖ Low share of contracts from project balance.
- ❖ Variable interest rates.
- ❖ Lack of investment pattern analysis by specialized software.
- ❖ Lack of contract transparency and third party auditing.
- ❖ Failure to withdraw the deposit during the period.
- ❖ Inadequate implementation of referral system.

After reviewing more than 50 types of smart contracts, the above items have caused their failure. The Crypto Bank team has implemented the following measures in the TRONCB contract to improve the above items.

**Note: All smart contracts are similarly fake.**

Regarding the announced cases, the following solutions have been considered:

- ❖ The Crypto Bank design team has set a daily investment limit for the TRONCB project.
- ❖ The project uses a new referral system, which is described in detail in the relevant section.
- ❖ The profit process is completed with a subset and you can collect referral profits and bonuses.
- ❖ In the TRONCB project, whenever you want to withdraw the deposit after deducting the penalty.
- ❖ About 90% of investors' deposits are related to the contract and the rest is related to the creator of the project and advertising.
- ❖ The interest rate for each investment plan is fixed.
- ❖ Different investment modes have been investigated by MATLAB simulator software (based on different forecasts).
- ❖ The verification contract has also been audited by the XAUD (Third Party) team.
- ❖ The necessary mechanism for withdrawing the principal of the capital is foreseen even in the initial moments of investment.
- ❖ A new referral system has been designed, which will be described in other sections.

**Note: In view of all the above, it informs that the project balance will never be zero and can always be used.**

## **Technical:**

The project consists of 4 investment plans, each plan has its own characteristics. Their distinction is as follows:

- 1- Minimum and maximum investment amount.
- 2- Period.
- 3- Daily and final profit.
- 4- Daily investment volume.
- 5- Withdrawal penalty earlier than due.
- 6- Referral Rewards.
- 7- Minimum referral to allow withdrawal.

## **Withdraw:**

Withdrawal of deposit from the project consists of three modes:

- A) After maturity and obtaining a minimum referral
- B) Before the end date
- C) After maturity and failure to obtain a minimum referral

**Note: Minimum referral is a percentage of the investment amount that is obtained by inviting friends and subscribing.**

In case (a), the principal and profit of the plan and the referral bonus can be withdrawn only at or after the due date.

In cases (b) and (c), due to the fact that the terms of the contract have not been observed, only the principal amount will be withdrawn after deduction of the fine.

**Note: It is recommended to withdraw the profit only at the due date or after it and also after earning the minimum referral.**

## **Referral:**

By using the invitation link that is created on the site for each wallet and publishing it for friends and their investment in the project, you can earn referral rewards for your account. And even if you do not have active capital, it will be credited to your account and will not be withdrawn until the time of investment.

**Note:** To make a profit, you must get a referral.

## **Different modes of project investment (project risks):**

- ❖ Perfect: Be an investor every day and everyone will withdraw at maturity.
- ❖ Critical: Do not invest every day and more than 50% of investors withdraw their capital before maturity.
- ❖ Normal: New investor is added to the project and the harvest is normal. (Less than 50% before maturity).
- ❖ Silence: Even in these circumstances, the new investor can enter the project and make a profit by joining.

According to the above explanation, which is the result of hours of efforts by Crypto Bank Group colleagues, the project is active and usable under any circumstances and the balance will not be zero.

## **Project creator recommends to investors:**

- ❖ Invest with knowledge of the terms (smart contract).
- ❖ Follow the rules.
- ❖ Accept the investment risk.
- ❖ Avoid harvesting earlier than the due date.
- ❖ Refer for profit.

END
